

A large, transparent sphere, resembling a glass ball or a planet, is the central focus. It reflects a detailed landscape of rugged, snow-capped mountains under a warm, orange and yellow sunset sky. The sphere is set against a solid teal background. The text 'Econ 2' and 'Principles of Macroeconomics' is overlaid on the upper part of the sphere.

Econ 2

Principles of Macroeconomics

Lecture 15: Monetary Policy,
Aggregate Demand/Aggregate Supply

Fractional Reserve Banking

- Bank: a firm that specializes in brokering between savers and borrowers, allowing borrowers to go to one firm instead of 1000s
- Banks are only required to keep a fraction of their deposits on hand as reserves
- Lends out the rest
- Creates new money in the form of a deposit in the borrower's account
- Deposit effectively increases the overall money supply
- Governments regulate banks and provide deposit insurance to protect depositors' funds.

Monetary Policy

- Buying and selling Treasuries changes the money supply
→ bond price → interest rate
- Target the Federal Funds Rate: the interest rates banks charge other banks for loans
 - determines flexibility in the banking system since banks can loan out more than they borrow
 - other important interest rates tend to follow the Federal Funds rate

Federal Funds Rate vs 30 Year Mort. Rate

Federal Funds Rate vs 30 Year Mortgage Rate, 97-16

Federal Funds Rate vs Interest Rates

Demand for Money

- Connect Monetary Policy to Interest Rates through the market for money
- Demand for Money: Why hold on to money (M1 Money)?

Demand for Money

- Wealth Box:

Demand for Money

- Benefit of holding wealth in the form of money :
- Cost of holding wealth in the form of money:
- Price of money vs. Return on illiquid assets?

Demand for Money

- Interest Rate = r

- Demand for Money:

Demand for Money

Demand for Money

- Point A:

$r = 5\%$

Money 1 trillion	Other Assets
---------------------	--------------

Demand for Money

- Point A to Point B:

$r = 5\%$		$r = 4\%$
Money = 2.0 trillion		Other Assets

Demand for Money

- What shifts the demand for money?

Demand for Money

- Point A: $r = 5\%$

$P = 100$

Money = 1 trillion	Other Assets
-----------------------	--------------

Demand for Money

- Point A to Point D:

P = 100		P = 120
Money = 2.5 trillion		Other Assets

Demand for Money

- What shifts the demand for money?

Demand for Money

- Point A: $r = 5\%$, $P = 100$

$Y = 2$

Money = 2 trillion	Other Assets
-----------------------	--------------

Demand for Money

- Point A to Point F: $r = 5\%$, $P = 100$

$$Y = 1$$

	Money = 0.5 trillion	Other Assets	
--	-------------------------	--------------	--

Supply of Money

- Set by the Central Bank/Federal Reserve
- Same supply of money at all interest rates

Money Market Equilibrium

Changing the Interest Rate

- Federal Reserve buys/sells bonds
 - Changes the interest rate
- 1-Year Bond with a value of \$100
 - Buyer purchases bond today, gets \$100 in 1 year
 - Price of bond today is less than \$100
- Interest Rate = $(\text{Return on the bond} / \text{Price of bond}) \times 100$
- Bond Price Change $\rightarrow$ Return on bond Change $\rightarrow$ r^* Change

Carrying out Monetary Policy

- How does the Fed enact monetary policy?
- Example: $r_1 = 5\%$, Fed wants to decrease $r_2 = 4\%$

Carrying out Monetary Policy

- How does the Fed enact monetary policy?
- Example: $r_1 = 5\%$, Fed wants to increase $r_3 = 6\%$

Why is the interest rate so important?

- What changes when r decreases?

- 1.

- 2.

- 3.

Monetary Policy in Action

- Example 1: $Y_1 = 8,000$, $r_1 = 6\%$ and $M_1 = 1$ trillion
- $\bar{Y} = 10,000$ (full employment GDP)

Monetary Policy in Action

- Example 1: $Y_3 = 12,000$, $r_3 = 2\%$ and $M_3 = 4$ trillion
- $\bar{Y} = 10,000$ (full employment GDP)

Effects of Inflation

- Example: $\bar{Y} = 10,000$ (full employment GDP), $r_1 = 5\%$,
 $M_1 = 1$ trillion, $CPI_1 = 100$
